

polygon meshes

polygon meshes representation

- which representation is good?
 - often triangles/quads only – will work on triangles
- compact
- efficient for rendering
 - fast enumeration of all faces
- efficient for geometry algorithms
 - finding adjacency (what is close to what)

vertices, edges, faces

- fundamental entities
 - n_v vertices
 - n_e edges
 - n_f faces
 - simple closed surface: $n_v - n_e + n_f = 2$
- fundamental properties:
 - topology: how faces are connected
 - geometry: where faces are in space
 - separate issues
 - algorithms mostly care about topology

topology vs. geometry

- same geometry
different topology

- same topology
different geometry

triangles

triangle[0]	(x0, y0, z0)	(x1, y1, z1)	(x2, y2, z2)
triangle[1]	(x1, y1, z1)	(x2, y2, z2)	(x3, y3, z3)
...

triangles

- array of vertex data
 - vertex[n_i][3]
 - vertex stores position and optional data (normal, uvs)
 - ~72 bytes per triangle with vertex position only
- redundant
- adjacency is not well defined
 - floating point errors in comparing vertices

indexed triangles

vertex[0]	(x0,y0,z0)
vertex[1]	(x1,y1,z1)
...	...

triangle[0]	0,1,2
triangle[1]	2,1,3
...	...

indexed triangles

- array of vertex data
 - vertex[n_v]
 - 12 bytes per vertex with position only
- array of vertex indices (3 per triangle)
 - int[n_t][3], often flattened in a single array
 - 24 bytes per triangle
- total storage: ~ 36 bytes (50% memory)

- topology/geometry stored separately/explicitly
 - adjacency queries are well defined

triangles strips

- since triangle share edges, let every triangle reuse the last one's vertices

vertex[0]	(x0,y0,z0)
vertex[1]	(x1,y1,z1)
...	...

strip[0]	0,1,2,3,4,5
strip[1]	...
...	...

triangles strips

- requires multiple strips for general case

vertex[0]	(x0,y0,z0)
vertex[1]	(x1,y1,z1)
...	...

strip[0]	0,1,2,3,4,5
strip[1]	...
...	...

triangle strips

- array of vertex data
 - vertex[n_v]
 - 12 bytes per vertex with position only
- array of lists of vertex indices
 - int[n_f][varyingLength]
- for long lists saves about 1/3 index memory

triangle fans

- idea similar to triangle strips
- different arrangement

vertex[0]	(x0,y0,z0)
vertex[1]	(x1,y1,z1)
...	...

fan[0]	1,2,2,3,4,7,6,0,2
fan[1]	...
...	...

quad meshes

- similar options as for storing triangles
 - flat quads
 - indexed quad meshes
 - quad strips, no fans

adjacency queries

- example queries
 - given a face, find adjacent faces
 - given an edge, find faces that share it
 - given a vertex, find faces that share it
- previous data structures
 - inefficient adjacency queries, $O(n)$

adjacency lists

- store all vertex, edge, face adjacency
 - efficient adjacency queries, $O(1)$
 - extra storage

[based on Finkelstein 2004]

partial adjacency lists

- store some vertex, edge, face adjacency
 - goal: efficient adjacency queries
 - goal: less storage

[based on Finkelstein 2004]

winged edge

- adjacency stored in edges
 - all adjacency in $O(1)$
 - little extra storage

[based on Finkelstein 2004]

edge	vertex 1	vertex 2	face left	face right	pred left	succ left	pred right	succ right
a	B	A	0	1	c	b	d	e

[Shirley]

winged edge

- tetrahedron example

vertex	edge
A	a
B	d
C	d
D	e

face	edge
0	a
1	c
2	d
3	a

edge	vertex 1	vertex 2	face left	face right	pred left	succ left	pred right	succ right
a	A	D	3	0	f	e	c	b
b	A	B	0	2	a	c	d	f
c	B	D	0	1	b	a	e	d
d	B	C	1	2	c	e	f	b
e	C	D	1	3	d	c	a	f
f	C	A	3	2	e	a	b	d

[Shirley]

defining normals

- face normal
 - geometrically correct
 - not for smooth surfaces
- vertex normals
 - geometrically “inconsistent”
 - for smooth surface approx.
